

Interview Q&A: matplotlib

1. What is matplotlib?

Matplotlib is a plotting library for the Python programming language and its numerical computation extensions, NumPy and SciPy.

2. What are the main differences between plt.plot() and plt.scatter()?

plt.plot() is used for plotting lines, while plt.scatter() is used for creating scatter plots.

3. How do you change the line style of a plot using matplotlib?

You can use the linestyle parameter, for example: plt.plot(x, y, linestyle='--')

4. How do you create a figure with a specified size using matplotlib?

fig, ax = plt.subplots(figsize=(8, 6))

5. How do you customize the appearance of a plot's title using matplotlib?

You can use the plt.title() function to set the title, and then use various options such as font size, style, and color to customize its appearance.

6. How do you create a legend for a plot using matplotlib?

You can use the plt.legend() function to add a legend to your plot.

7. How do you create a horizontal line on a matplotlib plot?

You can use the plt.axhline() function to create a horizontal line.

8. What is the purpose of the tight_layout() function in matplotlib?

The tight_layout() function adjusts the layout so that the elements fit within the figure area, making it easier to create plots with multiple subplots.
